Superstore Sales Dashboard

Task 2 — Power BI Dashboard Documentation

Figure 1. Dashboard preview provided for Task 2.

Note: This document describes the dashboard as shown in the provided screenshot and includes recommended final checks. It does not independently validate the underlying Power BI measures.

1. Project Overview

This project presents an interactive Superstore Sales Dashboard created in Power BI using the Superstore sales dataset. The dashboard is designed to provide a compact view of sales performance, profit, orders, customers, monthly trends, product performance, and customer segments. The dashboard uses a warm brown background with cream-colored visual panels.

2. Tools and Dataset

Tool: Microsoft Power BI Desktop. Dataset: the cleaned Superstore sales CSV used for Task 1. The dashboard uses fields such as Order Date, Sales, Profit, Order ID, Customer ID, Region, Segment, Category, Sub-Category, Product Name, and Discount where applicable.

3. KPI Cards

The top section contains four KPI cards: Total Sales (shown as 2.30M), Total Profit (shown as 286.40K), Unique Customers (793), and Count of Order ID (shown as 5.009K). For final presentation, rename “Count of Order ID” to “Total Orders” and format the value as 5,009 if the measure represents distinct orders. Verify each KPI against the dataset.

4. Visuals Included

• Sales by Month — a line chart showing monthly sales from January through December.

• Sales by Order ID — a scatter-style visual currently titled “Sales by Order ID”; recommended correction is “Discount vs Profit” with Discount on the X-axis and Profit on the Y-axis.

• Top 10 Sales by Product — a horizontal bar chart comparing the top products by sales.

• Category and Sub-Category by Sales — a column chart comparing category/sub-category values; verify that Sales is used as the value rather than counts of Category or Sub-Category.

• Sales by Segment — a donut chart showing the sales split across Consumer, Corporate, and Home Office.

5. Slicers and Interactivity

The dashboard includes Region and Segment slicers. Region options shown are Central, South, East, and West. Segment options shown are Consumer, Corporate, and Home Office, along with a select-all option. Test each slicer to confirm that the connected charts and KPI cards update as expected.

6. Design and Layout

The dashboard uses a brown canvas with pale cream visual cards, dark text, and a matching Superstore analytics logo. KPI cards and slicers are arranged along the top, while charts occupy the lower sections. This creates a consistent theme and a clear visual hierarchy. Improve readability by increasing small axis labels and product labels where possible.

7. Work Completed

• Loaded the Superstore dataset into Power BI.

• Created KPI cards for sales, profit, customers, and order count.

• Added a monthly sales trend line chart.

• Added a product sales bar chart.

• Added a category/sub-category comparison chart.

• Added a segment sales donut chart.

• Added Region and Segment slicers.

• Applied a brown-and-cream dashboard theme and placed the project logo.

8. Recommended Final Checks

1. Rename “Sales by Order ID” to “Discount vs Profit” if the visual is intended to show the relationship between Discount and Profit.

2. Confirm the scatter visual uses Discount on X-axis and Profit on Y-axis.

3. Use Sales as the value for the category/sub-category chart if the goal is to compare sales.

4. Format Total Orders as a whole number and confirm whether a distinct count of Order ID is appropriate.

5. Test the Region and Segment slicers.

6. Save the final .pbix file and export a PDF or screenshot for the GitHub repository.

9. Conclusion

The dashboard brings key sales and customer metrics into one view and provides a starting point for business performance analysis. After the recommended field and formatting checks, it can be included as the Task 2 deliverable in the data analytics internship repository.
